# Connecting more than 2 POS systems/cash registers

Normally, one PC comes with 2 COM ports, therefore only 2 POS systems/cash registers may be supported without COM port extension. Using a GV-Hub makes the extension possible. The following diagram illustrates how to use a GV-Hub to connect one GV-System with four graphic-mode POS systems. Please notice that an appropriate dongle is attached properly to the USB port of the GV-System.

Note: There are four types of dongles (1, 2, 3 and 4 ports) available to connect up to 4 POS systems/cash registers.
